

# Adding Coral to a Saltwater Aquarium

## What you will need

2 Rubber

6 Feet of 1/4  
inch

A medium-sized 1  
gallon food-grade  
plastic container.

A saltwater aquarium.

A piece of coral.

## Transportation

Pick out a coral that  
you want.

Fill the bag 1/2 way  
with water from the  
aquarium that the  
coral was in.

Fill the rest of the  
bag with air and tie  
the bag off with  
a rubber band.

While taking the  
coral back to your  
tank, make sure to  
keep the bag  
upright.

## Setting up

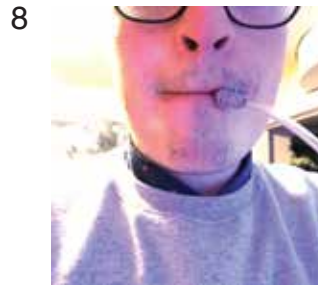

Place one end of  
the air tubing  
through one of the  
rubber bands.

Twist both of the  
rubber bands  
around the air tube  
until it is completely  
wrapped around.

Place the end of  
the tube without the  
rubber bands into  
your aquarium.

Suck on the end of  
the tube with the  
rubber bands to  
create a siphon.

## Acclimating the coral

9

Put the banded side of the tube into the container. Flow should ~ 2 drops/second.

10

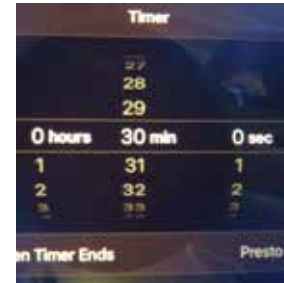

Open the bag that the coral is in.

12

Pour the water into the small container, and gently drop the coral into the water.

13

Wait for thirty minutes.

14

Remove the end of the air tube that is in your aquarium.

15

Place the coral into your aquarium.
